**CS 371**  
**Assignment #3**  
**Array's were never so easy**

Due 10/2/08, in class

The goal of this assignment is to write an assembler program that reads in two arrays of integers and then prints their dot product. Think about the declaration of the arrays and the loops that manipulate them.

**What to hand in**

Send me an email with three attachments:

- 1) your well formatted program (Don't forget header comments),
- 2) a jpeg (or similar) of a print screen showing the output, and
- 3) your test plan: a list of test cases. Each test case includes input, expected output and rational.

**Notes**

Better answers will include multiple procedures with appropriate parameters!
